Biological Approach for Training

ADOLESCENT GROWTH AND MATURATION: ASSEMENTS, INJURIES AND STRENGTH TRAINING

Quintin Roman

INTRODUCTION

Age based competition where adolescents are commonly pitted to compete against others of the same age can no longer be seen as an "all's equal". Recent contentions have raised questions about age based relevance for participation in sport and training. These contentions are based on the co-existing age, growth and maturation variations.

Age measured by time (years or months) or chronological age (CA) based training has tremendous limitations. CA is a poor indicator of the physiological and growth changes in adolescents (10-18 years as defined by the World Health Organization). This makes CA based training and competition systems ineffective.

As Istvan Balyi famously put it "adolescence is not only a time of great growth potential but is also a time of great sensitivity and risk". A deeper understanding is therefore required to effectively plan safe training systems that complement adolescent's functional capabilities. This paper details a review of adolescent growth and maturation assessment indicators, associated injuries and outlines effective strength training structures.

WHAT IS GROWTH AND MATURATION?

Growth refers to the progression in the size and shape of the body, its organs and circulatory systems until adulthood is reached. Growth generally follows a definite sequence during puberty which generally starts from the outside in, from the hands and feet, the limbs (arms and legs) and spine. Lastly, the shoulders grow broader and chest expands for boys and hips and pelvis widen for girls. Although this growth sequence is fairly standard in all adolescence, the timing and rate of this sequence differs from person to person.

Maturation is the process whereby humans progress from childhood to adulthood. The timing and tempo of this process varies from individual to individual because we all have our own biological clocks. Specific maturational indicators suggest that there are gender differences in growth timing and tempo (35). In males, maturational ageing is reflected by the development of the genitals (penis and testes), volume of testes and pubic hair development. In females, maturational indicators are reflected in pubic hair, breast development and menarche or first period. Timing describes how chronological age corresponds with biological age, while tempo refers to the rate of how quickly children pass through their growth spurts to attain sexual maturity.

PRE-PUBESCENT TRAINING PROGRAMS

PROGRAMS	FOCUS	EQUIPMENT	INTENSITY
Level 1-2 	<ul style="list-style-type: none"> • Bodyweight exercises and progressive variations • Obstacle avoid, agility, quickness and proprioception • Joint and core stability • Circuit training / strength endurance / aerobic based • Competency based variations 	medicine balls, soccer balls, resistance tubes, jump ropes, mini hurdles, jump ropes, agility ladders, resistance surface variations	<ul style="list-style-type: none"> • low to moderate • 1-2 repetitions • 2-3 times frequency • 3-5 minutes rest between sets • 3-11 TSA

PUBESCENT TRAINING PROGRAMS

PROGRAMS	FOCUS	EQUIPMENT	INTENSITY
Level 2-3 	<ul style="list-style-type: none"> • Combination of unilateral + bilateral exercises variations • Progress to multi joint movements • Focus on weight training safety and correct lifting technique education • Reduce mechanical loading to improve strength development • Families 2 strength unit(s) after PMW / avoid of overuse • Max. Strength window at PMW • Low to med intensity progression • Relearning to quad-bicep ratio 	Light free weights, (weights include tennisballs, body bars, medicine balls, steel weight machines)	<ul style="list-style-type: none"> • Moderate to high • 8-15 RM • 2-3 sets • 2-3 frequency • 1-2 minutes rest (dependent on exercise intensity) • 2-11 to 20 TSA

POST-PUBESCENT TRAINING PROGRAMS

PROGRAMS	FOCUS	EQUIPMENT	INTENSITY
Level 3-4 	<ul style="list-style-type: none"> • Towards specific exercises and adult type training • Complex 10 and 40% routines Eg. Cleans and snatches • Refined lifting techniques • Rotational, single leg jumps, un-anticipated changes of direction game specifically - with good jump land mechanics • High intensity metabolic conditioning • Personalized training cycles 	Power Platforms and heavier free weights (unilateral and barbells)	<ul style="list-style-type: none"> • Training volume and intensity dependent on training goals and competition calendar • Maximum 10-12RM • Strength 3-4RM • Max. Strength 5-8RM • Power 4-8RM

Warm-up Routines

Help prepare athletes for training and competition.

Goal → Maximize sports performance, ↑ROM & ↓ injuries.

3 Key Components:

- i Increase core body temperature.
- ii Establish and improve ROM through dynamic drills.
- iii Sport/training specific drills.

PRACTICAL SESSION
